

327 Milestone 2

Title: Steganography Project

Description: Project is supposed to have a Interface where you can at least encode and decode images using steganography LSB strategy, and will probably have a way to encode and decode hidden messages into plain text using null characters.

Status of the Project: The project is currently able to decode images, encode images, save the encoded images, and display the image that you are currently working on.

Milestones yet to be accomplished: Plain text encoding, Plain text decoding

The project is done with the least amount of work that I am happy with, but I have figured out a way to encode messages into plain text using a asci code that does not display or create a space. So my plan for milestone 3 would be to get the plain text encoding and decoding done. I will also get it so most of the ways you can accidently crash the program are not a problem.
